"RIKEN Arabidopsis full length cDNA clones (RAFLs) sequenced
SSP consortium (Salk/Stanford/PGEC).";
Submitted (MAY-2003) to the EMBL/GenBank/DDBJ databases.
--- FUNCTION: This enzyme condenses acetyl-CoA with acetoacet
form HMG-COA, which is the substrate for HMG-COA reductas

CATALYTIC ACTIVITY: Acetyl-CoA + H(2)
hydroxy-3-methylglutaryl-CoA + CoA.

PATHWAY: Production of mevalonate fro
synthesis of sterols and isoprenoids.
ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IsoId=P54873-2; Sequence=VSP_008902;
SIMILARITY: Belongs to the HMG-CoA synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Event=Alternative splicing; Named isoforms=2;

BATHWAY: Production of mevalonate from HMG-CoA prior |
BATHWAY: Production of separonids.

SYNTHeeis of sterois and isoprenoids.

SIMILARITY: Belongs to the HMG-CoA synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 153
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                164

               similarity).

CATALYTIC ACTIVITY: Acetyl-CoA + H(2)O + acetoacetyl-hydroxy-3-methylglutaryl-CoA + CoA.

PATHWAY: Production of mevalonate from HMG-CoA prior synthesis of sterols and isoprenoids.

SIMILARITY: Belongs to the HMG-CoA synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 408

Human; gene; ss; chromosome 5; hydroxymethylglutaryl-coenzyme A synthase; HMG-CoA synthase; cholesterologenesis; therapeutic; diagnostic; genotype; antibody; synthase; carcinoma.

Human hydroxymethylglutaryl-coenzyme A synthase protein cDNA

ABS54409;

22-NOV-2002

(first entry)

ABS54409 standard; cDNA; 2002

The polynucleotide and polypeptide are CC useful as models for the development of human therapeutic targets for the CC development of human therapeutic proteins and as targets for the CC development of human therapeutic proteins and as targets for the CC polypeptide in cells and tissues. The polynucleotide is useful for CC activity of the enzyme gene in clinical trials and in treatments, in CC diagnostic assays for qualitative changes in expression of enzyme nucleic activity of the enzyme gene in clinical trials and in treatments, in CC diagnostic assays for qualitative changes in expression of enzyme nucleic target that can be used to tailor treatment in an individual. The CC golypeptide is useful to raise antibodies, as a reagent in assays (CC target that can be used to tailor treatment in an individual. The CC golypeptide is useful to raise antibodies, as a reagent in assays (CC designed to quantitatively determine levels of the protein in biological compensation binding assays, in cell-based or cresponding protein is competition binding assays; in cell-based or cell-free systems; in CC competition binding assays; in cell-based or cell-free systems; in absence of, inappropriate, or unwanted expression of the polypeptide. The sequence presented is the human HMG-COA synthase protein cDNA, the gene CC for which is located on chromosome 5
                                                                                                                                                                                                                                                                                                                                                                                       δ
                                                                                                                                                                                                                                                                                                                                                                                                                      밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5'UTR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; cytoplasmic 3-hydroxy-3-methylglutaryl coenzyme A synthase; HMG-CoA synthase; immune response; drug screening assay; pharmacogenomic analysis; chromosome 5; gene; ss.
The present invention relates to the isolation of a novel human enzyme that shows a high degree of similarity to human cytoplasmic 3-hydroxy-3-methylglutaryl coenzyme A (HMG-COA) synthase. The invention also
                                                                                                      New isolated human synthase peptide and gene encoding the enzyme, useful as models for developing human therapeutic targets, aid in the identification of therapeutic proteins and as therapeutic targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo sapiens

```
CC discloses polynucleotide sequences encoding the novel enzyme of the cinvention. Both the polypeptide and polynucleotide sequences are useful CC as models for the development of human therapeutics, for identifying CC therapeutic proteins, as targets for development of human therapeutic CC agents, and as query sequences to perform a search against sequence data CC bases to identify other family members of related sequences. The CC polypeptide is useful to raise antibodies or to elicit another immune CC elevels of the protein in biological fulds, as markers for tissues in CC which the corresponding protein is preferentially expressed, in drug CC screening assays, in cell-based or cell-free systems, to identify CC compounds that modulate synthase activity of the protein in its natural CC state, or an altered form that causes the specific disease or pathology CC associated with the synthase activity of the protein in its natural CC molecule that normally interacts with the synthase protein, and an CC molecule that mormally interacts with the synthase protein, and in CC pharmacogenomic analysis. The polymucleotide is useful for monitoring the effectiveness of modulating compounds on the expression or activity of the human synthase gene in clinical trials or in a treatment regimen, in CC diagnostic assays for qualitative changes in a human synthase nucleic cord that while not necessarily causing a disease, nevertheless affects the CC encodes human human cells, tissues and organisms. The present sequence encodes human synthase is antisense constructs to control human synthase cons

Composition comprising several cDNAs that are differentially expressed treated human C3A liver cell cultures, useful for treating liver disorders. in

Claim 1; SEQ ID NO 98; 41pp; English.

The invention relates to a composition comprising several cDNAs that are differentially expressed in a liver disorder. The composition is useful for treating liver disorder such as hyperlipidaemia, hypertension, type II diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a cDNA. A protein encoded by the cDNA is useful for a high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combounds under conditions to allow specific binding, and detecting specific binding between the protein and a or a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       molecule or compound, therefore identifying a ligand which specifically binds the protein. The composition is useful for detecting and quantifying differential gene expression, can used in gene therapy, t formulate prognosis and to design a treatment regimen and to monitor the efficacy of treatment. The present sequence represents a cDNA differentially expressed in a liver disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 3722 BP; 1121 A; 645 C;

                                       S
                                                                                                                                                                                             The invention relates to isolated polynucleotide (I) and polypeptide (II) C sequences. (I) is useful as hybridisation probes, polymerase chain CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used C in diagnostics as expressed sequence tags for identifying expressed CC activity of (II) or to treat disease states involving (II). (II) is C useful for generating antibodies against it, detecting or quantitating a CC polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging CC supplement. (II) and its binding partners are useful in treating disorders creating aberrant protein expression or biological activity. The CC polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations creaming actides expressed for the sorders or other traits to assess biodiversity and creaming actides equences. AAS64197-AAS94564 represent novel human diagnostic CC coding sequences of the invention. Note: The sequence data for this CC electronic format directly from WIPO at fig., wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁

ACC62346 to ACC62465 represent FCR primers and probes for human NOVX sequences, which are used in examples from the present invention. ABR54277 represents a human trypsinogen protein given in comparison with	disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, infectious disease, anorexia, cancer-associated cachexia, cancer, Alzheimer's disease, Parkinson's disease, immune disorders,	congenical actemat hyperplasta, prostate cancer, tataletes, mecapolic disorders, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host	antibodies can be used in the treatment and diagnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, valve disease, tuberous sclerosis, scheroderma, obsetty, transplantation,	antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and	hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antiasthmatic, metabolic, immunomodulator, neuroprotective, nootropic,	o 42. ACC62236 to ACC62345 encode the human NOVX proteins given in 34167 to ABR54276. NOVX sequences have antiatherosclerotic, cardia:	The present invention describes isolated human NOVX proteins, where X is

The present invention describes isolated human NOVX proteins, where X is CC 1 to 42. ACC6236 to ACC62345 encode the human NOVX proteins given in CC ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, CC hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, CC antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, CC antiasthmatic, metabolic, immunomodulator, neuroprotective, nootropic, CC antiparkinsonian and antilipaemic activities, and can be used in gene CC therapy. NOVX proteins are useful for treating or preventing a pathology associated with the human disease. NOVX nucleic acids, proteins and CC antibodies can be used in the treatment and disgnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic congenital adrenal hyperplasia, prostate cancer, fertility, haemophilla, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host conserved the sease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, cancer-associated cachexia, cancer, alled selevia, cancer, cancer, disease, cancer, disease, parkinson's disease, immune disorders, cancer, dequences, which are used in examples from the present invention.

CC ACC62346 to ACC62465 represent PCR primers and probes for human NOVX sequences, which are used in examples from the present invention.

CC ABR54277 represents a human trypsinogen protein given in comparison with the human NOV35b protein in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

XX

Novel human proteins and nucleic acid encoding the proteins, useful for protein or nucleic acid e.g. cardiac and neurological disorders.

PT diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

PT diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

CC protein or nucleic acid e.g. cardiac and neurological disorders.

XX

Claim 20; Page 242; 460pp; English.

CC antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HUV.

CC antidiabetic and antilipaemic activities, and can be used in gene etherolic acids, proteins and dispases. Nova nucleic acids, proteins and can be used in the treatment and diagnosis of cardiomyopathy.

CC antibodies can be used in the treatment and diagnosis of cardiomyopathy.

CC antibodies can be used in the treatment and diagnosis of cardiomyopathy.

CC disorders, neoplasm, lymphoma, uterus cancer, fetrility, haemoplatiation, congenital heart defects, metabolic disease, publication, congenital heart defects, metabolic disease, publication, congenital heart defects, metabolic disease, publication, congenital disease, multiple sclerosis, forcer associated cachexia, cance

The present invention describes isolated human NOVX proteins, where X is CC 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in ABS4167 to ABR4276. NOVX sequences have antiatheroscierotic, cardiant, CC ABS4167 to ABR4276. NOVX sequences have antiatheroscierotic, cardiant, CC antiasthmatic, metabolic, immunomodulator, neuroprotective, nortropic, antiasthmatic, metabolic, immunomodulator, neuroprotective, nortropic, CC antiasthmatic, metabolic, immunomodulator, neuroprotective, nortropic, CC antiparkinsonian and antilipaemic activities, and can be used in gene c therapy. NOVX proteins are useful for treating or preventing a pathology CC associated with a NOVX protein in humans and for treating a syndrome CC associated with the human disease. NOVX nucleic acids, proteins and CC antibodies can be used in the treatment and diagnosis of cardiomyopathy, CC antibodies can be used in the treatment and diagnosis of cardiomyopathy, CC atherosclerosis, hypertension, congenital heart defects, acrtic stenosis, C valve disease, tuberous sclerosis, scleroderma, obesity, transplantation, CC disorders, neoplasm, lymphoma, uterus cancer, diabetes, metabolic c hypercoagulation, idiopathic thrombocycopenic purpura, graft versus host CC disorders, bronchial asthma, Crohn's disease, multiple sclerosis, CC hypercoagulation, idiopathic thrombocycopenic purpura, graft versus host CC disorders, disease, Parkinson's disease, immune disorders, cancer, Alzheimer's disease, Parkinson's disease, immune disorders, cancer, Alzheimer's disease, Parkinson's disease, immune disorders, cancer, CC Alzheimer's disease, Parkinson's disease, immune disorders, cancer, CC Alzheimer's disease, anorexaia, cancer-associated cachexia, cancer, CC Alzheimer's dise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The present invention describes isolated human NOVX proteins, where X is CC 1 to 42. ACC6236 to ACC62345 encode the human NOVX proteins given in CC ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, CC hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, CC antidiabetic, antiinfertility, haemostatic, netunosuppressive, cytostatic, antiinfertility, haemostatic, neuroprotective, mootropic, antiinsthmatic, metabolic, immunomodulator, neuroprotective, mootropic, CC antiparkinsonian and antilipaemic activities, and can be used in gene CC therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome CC antibodies can be used in the treatment and diagnosis of cardiomyopathy, CC altherosclerosis, hypertension, congenital heart defects, aortic stenosis, CC valve disease, tuberous sclerosis, scleroderma, obseity, transplantation, CC disorders, neoplasm, lymphoma, uterus cancer, diabetes, metabolic congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic congenital adrenal hyperplasia, cancer, diabetes, metabolic congenital adrenal probessation, cancer-associated cachexia, cancer, CC infectious disease, anorexia, cancer-associated cachexia, cancer, CC infectious disease, parkinson's disease, immune disorders, cancer, ACC6236 to ACC62465 represent PCR primars and probes for human NOVX conditions, with the human trypsinogen protein given in comparison with the human NOV35b protein in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

Novel human proteins and nucleic acid encoding the proteins, useful idiagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

Claim 20; Page 243; 460pp; English.

CC The present invention describes isolated human NOVX proteins, where X is CC 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in CC ABR84167 to ABR84276. NOVX sequences have antiatherosclerotic, cardiant, CC hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, CC antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, CC antignation, metabolic, immunomodulator, neuroprotective, noctropic, cardiant the representation of the antiparkinsonian and antilipaemic activities, and can be used in gene CC associated with a NOVX protein in humans and for treating a pathology cascociated with the human disease. NOVX nucleic acids, proteins and CC antibodies can be used in the treatment and diagnosis of cardiomyopathy, CC valve disease, tuberous sclerosis, congenital heart defects, aortic stenosis, congenital adraral hyperplasia, prostate cancer, diabetes, matabolic congenital adraral hyperplasia, prostate cancer, diabetes, metabolic congenital adraral hyperplasia, prostate cancer, fertility, haemophilia, CC disease, AIDS, bronchial asthma, Cronn's disease, multiple sclerosis, cancer associated cachexia, cancer.

CC disease, AIDS, bronchial asthma, Cronn's disease, multiple sclerosis, cancer side scase, and the congenital adraral hyperplasia, cancer associated cachexia, cancer.

CC Alchaimer's disease, Parkinson's disease, immune disorders.

CC Alchaimer's disease, Parkinson's disease, immune disorders.

CC Alchaimer's disease, Parkinson's disease, immune disorders.

CC Sequences, which are used in examples from the present invention.

CC Sequences, which are used in examples from the present invention.

CC the human NOV35b protein in the exemplification of the present invention.
